

Times Table Tester

A primary school teacher needs a way of asking questions to test children on their times tables

They need to cover the tables up to 12

The system should create a random times table question (like, “what is 5 times 7”)

If the child gets the answer right it needs to say “correct”. If they get it wrong it needs to tell them it’s wrong

Times Table Tester

Program the Times Table Tester in Python

Test your program carefully to make sure it works as intended

Times Table Tester

Extending the program:

1. Make the child give an answer until they get it correct
2. Give the child three guesses. If they get the answer right in three guesses the program should tell them how many guesses they used. Otherwise it should tell them the right answer
