# Using Dreamweaver

Writing websites in HTML using a text editor is hard work

Adobe Dreamweaver is a piece of WYSIWYG software that should make things easier

When you first open Dreamweaver there are a bunch of questions to answer… Use the **Visual Guide** to work through these

Using Dreamweaver

Folders are super-important when making websites

Using Dreamweaver

Key points for today:

1. Setting up the homepage using 1 Header block and 3 Div blocks
2. Adding a heading, navigation text and an intro to the homepage
3. Saving the homepage as **index.html**
4. Saving the homepage in the **right folder**
5. Moving all the images you might want to use into the **same folder as the homepage**

Using Dreamweaver

Homepages are **always** called **index.html**

They just are

Web browsers know this and know what to look for

Using Dreamweaver

Other tasks:

6. Copy the homepage **three times**
7. **Rename** each page:
   a. frog.html
   b. tiger.html
   c. elephant.html
8. Take **one** of the pages. Replace the introduction with writing about the animal
9. Add an **image** to the page (insert > image)
